🚚 Raising a transfer request

Move bales from one store to another — with the bale numbers you want sent.

For office staff · every active user may raise one · the dispatcher at the source logs what actually leaves, the receiver confirms what arrives · an admin approves each stage

THE ONE RULE

You order by bale NUMBER. The bot never picks bales for you.

Your numbers ride the request as 📌 **Ordered** guidance. The dispatcher ticks the bales that physically leave; if one of yours is gone, the card says so and a person chooses the replacement — never the bot (business rule §2).

Three ways to raise it

A · Type the bale numbers — one line in the chat. Fastest when you have the numbers.

B · Tap through — 🔁 Move Stock → 🚚 Transfer Stock. Store → design → shade → how many → where to.

C · Say it in words — "Transfer package 5801 to Kano". The bot reads it and lands you on the same screens as A.

Before you start

- Have the printed bale numbers from the packing list.
- All bales of one request must sit in ONE store. Two stores = two requests.
- Know the destination store's name as the bot spells it (Kano office, IDUMOTA, Lagos).
- One request per load: if the same load is already open, the bot shows it instead of making a twin.

What happens after you tap ✅ Send

🔴 Requested you → 🚚 Dispatch Abdul ticks bales + load photo → 🛂 Admin review approves the package → 🟡 In transit on the road → 📦 Receipt Musa reports + photo → 🟢 Received admin confirms

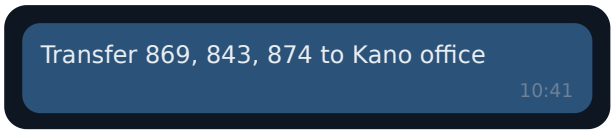

Track it any time: 🔁 Move Stock → 📋 Transfers. Legend: 🔴 requested · 🛂 parked for approval · 🟡 in transit · 🟢 received · ⧉ sent as a duplicate · B bales · T loose thans · 6/10B = received so far

Method A — type the bale numbers (fastest)

One message. Numbers separated by commas or spaces, then **to** and the destination store. Up to 50 numbers. The bot finds every bale on the shelf, groups them by design and shade, and pins your numbers to the order.

1 Type the line

Any of these work. The word **Transfer** (or Move / Send) at the front tells the bot what you mean; the numbers are the bales; everything after the last **to** is the destination.

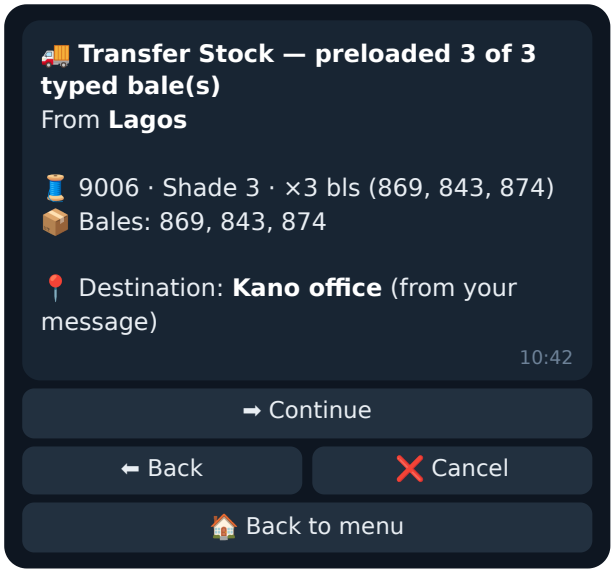

also: `Move bales 869 843 874 to Kano` · `Transfer package 5801 to Kano` · `Transfer packages 5801, 5802, 5803 to Kano`

> You do not type the source. The bot reads where the bales sit. If they sit in two stores it loads the first store's bales and lists the others as *in IDUMOTA, not Lagos — start a separate transfer.*

2 Check the preload card

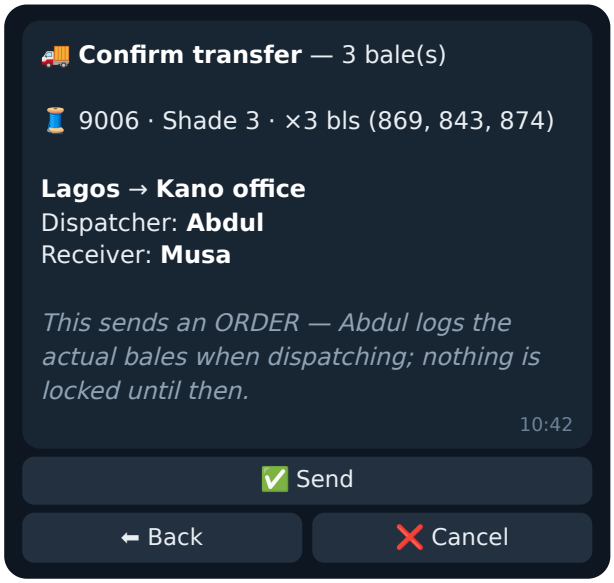

The bot shows what it loaded, grouped by design and shade, with your numbers pinned. A bale it could not load is listed with the reason (already sold, in transit, in another store, not on record) — it is never swapped for a neighbour.

> When the destination in your message matched a store, the button reads ➡ **Continue**. Otherwise it reads ➡ **Pick destination** and the next screen asks where to.

3 Confirm and send

The dispatcher at the source and the receiver at the destination are picked for you when each store has one person; a chip list appears when a store has several.

> Nothing moves on Send. Stock stays sellable at the source until the dispatcher logs the load. Your numbers are an order, not a lock.

Method B — tap through the wizard

Use it when you know the design and shade but not the bale numbers. Five taps. The dispatcher chooses the physical bales when dispatching.

🏠 Menu › 🔁 Move Stock › 🚚 Transfer Stock

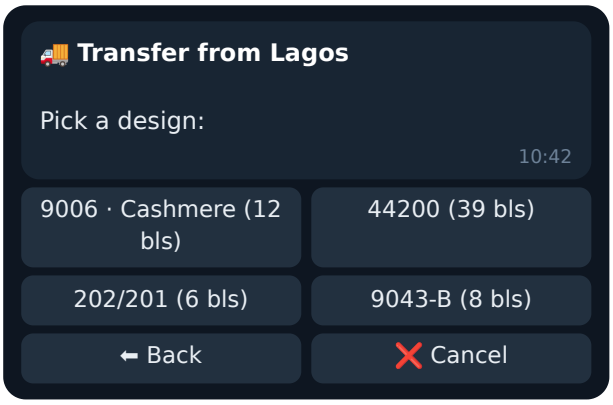

1 From which warehouse?

Only stores holding stock are offered.

2 Pick a design, then a shade

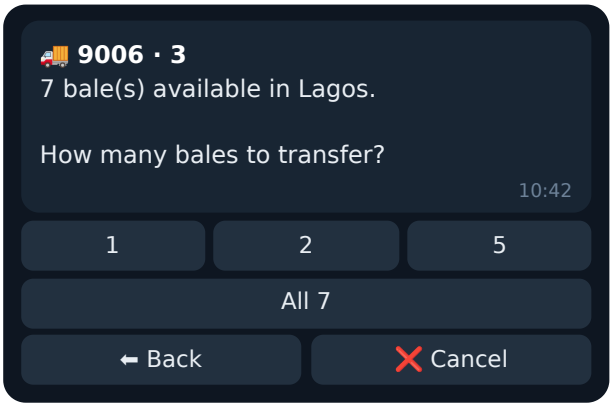

Each chip carries the count on that shelf. The category shows after the design when one is set.

3 How many bales?

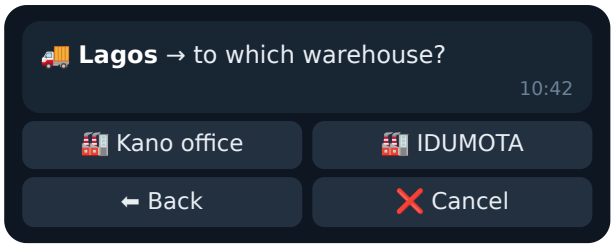

Chips 1 · 2 · 5 · 10 up to what is available, plus **All**.

4 To which warehouse?

Then the people are resolved (auto-picked when a store has one), and the same ✅ Send confirm card as Method A appears — without pinned numbers, because none were typed.

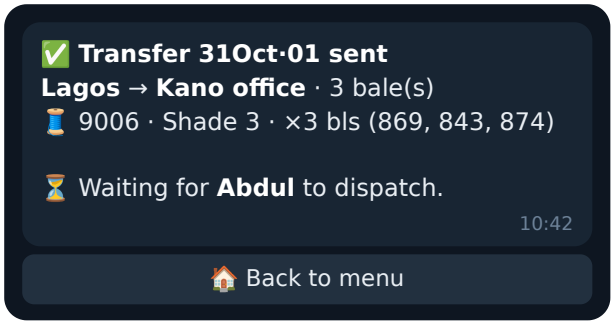

> Prefer Method A when you hold the packing list: typed numbers are pinned and shown to the dispatcher as 📌 **Ordered: 869, 843, 874**; the wizard cannot pin numbers.

After ✅ Send — what you see, what the others see

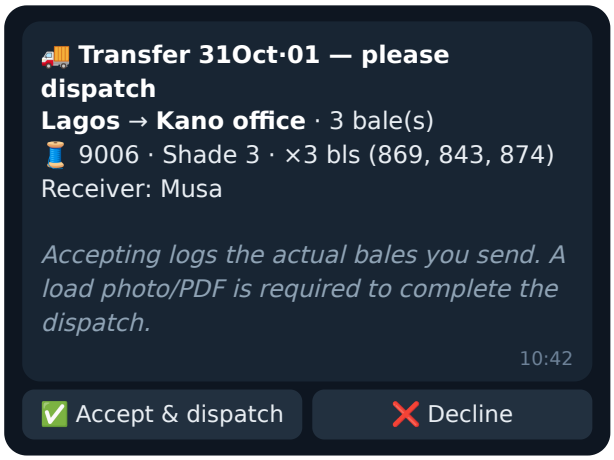

1 Your receipt

The confirm card becomes the receipt, with the reference you quote from now on (date · number of the day).

2 The dispatcher's card (Abdul)

He taps Accept, ticks the bales that physically leave — your numbers shown as 📌 Ordered — then must attach the load photo or PDF. Without the file nothing moves.

3 Where is it? 📋 Transfers

🔁 Move Stock → 📋 Transfers lists every open transfer as one row: date·number, the dot, the route, the quantity, who holds it and for how long. Tap a row to open its card.

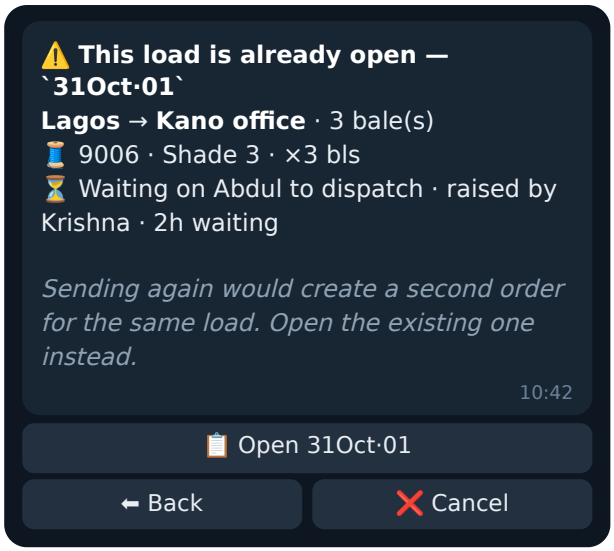

> If a transfer waits on its holder for more than 3 days every admin is told too; the holder's own card is re-sent every reminder round.

4 The twin guard

If the same load (same route, same designs, shades and quantities) is already open, Send does not create a second one. You get the existing reference instead; only an admin may **Send anyway**, and that copy is marked ⧉.

> Tapping Send twice on a slow network sends ONE request: the bot recognises its own repeat and shows *was already sent*.

Quick answers

- **A bale I typed is not on the card** — read its reason line: sold, in transit, in another store, or not on record. Fix the number or start a separate transfer for the other store.
- **The dispatcher sent different bales** — allowed. Physical truth wins; the confirm screen told him in words which ordered number he replaced.
- **Only some bales arrived** — the receiver ticks the ones that came (📦 Only some arrived); the rest stay on the road and the row reads 6/10B until the last bale.
- **I want to cancel** — there is no cancel after Send. The dispatcher taps ❌ Decline, which returns the bales to the source.
